

Ecommerce Sales Dashboard – Summary Report

Project Objective

To analyse ecommerce sales data and create an interactive Excel dashboard that helps stakeholders understand sales performance, customer behaviour, and product trends.

Data Overview

The dataset includes:

- Order details
- Product information
- Customer demographics
- Sales and profit metrics
- Regional and category-level data

Methods Used

- **Data Cleaning:** Removed duplicates, corrected date formats, standardized text fields, handled missing values.
- **Data Transformation:** Created calculated columns such as Profit, AOV, Discount %, and Month-Year.
- **Visualization:** Built KPI cards, charts, heatmaps, and slicers for interactive filtering.

Key Insights

- Revenue shows a steady upward trend across months.
- North and West regions generate the most revenue.
- A small percentage of customers contribute to a large portion of total sales (Pareto pattern).
- Certain products show low profitability, indicating potential pricing or cost issues.

Business Recommendations

- Increase marketing efforts in high-performing regions.
- Improve pricing strategy for low-profit products.
- Introduce loyalty programs for high-value customers.
- Stock more inventory for top-selling categories.
- Explore seasonal promotions based on monthly trends.

Conclusion

The Ecommerce Sales Dashboard provides a clear, data-driven view of business performance. It enables faster decision-making and highlights opportunities for growth, optimization, and customer engagement.
